1. Introduction and Project Overview

Project Background

Stationery websites often need to serve users who want to make quick choices from visually similar products. For younger users, small text, crowded layouts, weak contrast, unclear feedback, and broken mobile layouts can make simple shopping tasks difficult. Scribbly was designed to provide a more approachable experience through clear hierarchy, friendly language, strong product imagery, simple navigation, and forgiving interactions.

Product / Service

Scribbly is a fictional stationery e-commerce brand for everyday school and creative supplies such as notebooks, pens, sticky notes, highlighters, desk accessories, planners, tapes, and pouches. The interface is designed around school-age users while remaining clear enough for parents or guardians who may help with purchasing.

Problem Statement

The design problem is to create a visually distinctive stationery experience without making the interface visually overwhelming. Users need quick navigation, readable content, clear prices, understandable actions, and reliable feedback. At the same time, the brand needs a playful identity that feels appropriate for school supplies. The design therefore has to balance usability, visual appeal, accessibility, branding, responsiveness, and implementation feasibility.

Target Users

The primary target users are children and school-age students, approximately 6–16 years old, who browse stationery using phones, tablets, or shared family devices. The store is designed specifically for younger stationery shoppers, with playful visuals, age-appropriate wording, clear product presentation, and simple interactions that make browsing easy and enjoyable.

Parents and guardians are also important secondary users, as they may assist children in selecting products, checking prices, or completing purchases. Therefore, the interface balances a fun, child-friendly appearance with clear information and straightforward navigation that is also convenient for adults.

Stakeholders

Stakeholder	Needs / Expectations	Possible Conflict
Students /	Fun design, easy browsing, clear	Too many colours or decorations may

Kids	text, simple buttons, and quick responses.	make the website confusing.
Parents / Guardians	Clear prices, easy product information, simple cart and checkout, and a safe and trustworthy shopping experience.	Parents may prefer a simpler design, while kids may prefer a more colourful and playful design.
Store Owner / Business	Attractive product display, clear offers, strong branding, and more product sales.	Too many promotions or advertisements may make the website look crowded.
School / Teachers	Easy access to useful school stationery, clear product details, and suitable products for students.	They may focus more on useful and affordable products, while students may choose products mainly because of their design or appearance.

User Persona

Persona Attribute	Details
Name	Muhammad Sajjad
Age	13
Context	Uses a phone and a family tablet to browse school supplies and creative stationery.
Behavior	Likes colorful products and quick visual browsing.
Goals	Find products quickly; understand PKR prices; add/remove items; sign in easily; review before confirming.
Pain Points	Tiny buttons, crowded pages, cropped images, unclear form errors, hidden navigation, and irreversible actions.
Needs	Readable text, clear labels, visible feedback, responsive layout, simple forms, error recovery, and consistent navigation.

User Needs and Goals

- Understand what each button will do before selecting it.
- Find products through browsing, search, and category filters.
- See prices in a familiar local currency (PKR).

- Know when an item has been added to the bag.
- Change quantity or reverse a removal.
- Receive specific form errors near the related input.
- Review information before a final confirmation.
- Use the website comfortably on mobile, tablet, and desktop.

Major Usability Requirements

Requirement	Design Response
Readability	Larger body/form text, consistent heading hierarchy, short paragraphs, readable line spacing.
Visibility	Visible bag count, status/toast messages, clear active controls and account actions.
Error tolerance	Inline validation, undo removal, preserved form input, review-before-confirm.
Consistency	Repeated header, buttons, typography, spacing, icon style, and interaction language.
Responsiveness	Layouts adapt to desktop, tablet, and mobile without broken sections.
Accessibility	Keyboard focus, labels, alt text, contrast-aware buttons, reduced-motion support.
Low cognitive load	Clear sections, familiar labels, concise choices, recognition over recall.

2. Information Architecture and User Flows

Information Architecture

The information architecture groups the experience into shopping, account, and supporting-information areas. Important actions are kept close to where users expect them, reducing unnecessary navigation.

Top-Level Area	Pages / Functions
Home	Hero, product preview, About, FAQs, school/bulk orders
Products	Browse, search, category filters, product cards, product details
Cart / Bag	View items, edit quantity, remove items, undo removal, continue to checkout
Checkout	Delivery details, payment choice, order review, confirm demo order
Order Successful	Success confirmation, order summary, order/reference number
Account	Login, Sign Up, Dashboard, Logout

Sitemap

User Flows:

Product Purchase Flow:

This is the most important flow because it shows the complete shopping journey from discovering a product to completing an order.

Product Purchase Flow

From browsing to order confirmation

Account Access Flow

Account Access Flow

For new and existing users

This is useful because it shows how a new or returning user enters the system and reaches their personal dashboard.

Navigation and Interaction Requirements

- Persistent and consistent header/navigation language across major screens.
- Login and Sign Up remain discoverable for guest users, including mobile layouts.
- Bag state is visible and persists during the session.
- Buttons use action-oriented labels rather than vague wording.
- Back/continue actions are available where users may need to change direction.
- Mobile layouts prioritize essential actions instead of hiding them.

03. Brand Identity and Visual Design

Logo and Design Rationale

The Scribbly identity combines a playful stationery mascot with a handwritten-style wordmark. The mascot visually communicates the school/stationery theme without requiring explanation, while the informal wordmark gives the brand a friendly and approachable tone. During the redesign, the original logo, mascot shape, wordmark style, and artwork colors were intentionally preserved rather than redrawn. This supports recognition and consistency across the website and branded artifacts.

Visual Consistency Rules

- **Colors:** Use the same Scribbly violet, lavender, yellow, cream and dark ink colors throughout the website.
- **Typography:** **DM Sans** is used for normal UI text, headings, buttons, navigation and forms. **Gloria Hallelujah** is used only for short handwritten/accent text.
- **Buttons:** Buttons maintain consistent rounded shapes, styling and focus states across pages.
- **Cards & Forms:** Product cards, forms and content containers use consistent rounded corners, spacing and borders.
- **Navigation:** The header and navigation follow the same visual structure across the website.
- **Images:** Product images follow a consistent square presentation and fill their available media area.
- **Logo:** The Scribbly logo/mascot keeps its original shape, typography and brand colors.
- **Feedback:** Interactive actions use consistent visual feedback, such as focus states and confirmation messages.

04. Online Presence and Interface Design

Final Connected Screens

Screen	Purpose	Important HCI Features
Home	Introduces the brand and provides access to products, About, FAQs, school orders, and contact information.	Clear visual hierarchy, prominent hero section, visible CTAs, consistent navigation.
Products	Allows users to browse and explore the stationery catalog.	Search, category filters, consistent product cards, clear prices, visible Add to Bag action.
Cart	Allows users to review and manage selected products.	Editable quantity, remove option, undo feedback, subtotal visibility, clear empty-cart state.
Checkout	Allows users to enter delivery information, select payment, and review the order before confirmation.	Form validation, clear field labels, payment selection, order summary, review-before-confirmation.
Order Success	Confirms that the order has been placed successfully.	Clear success feedback, order/reference information, order summary, continue shopping option.
Login	Allows returning users to access their account.	Clear form labels, validation messages, password visibility, consistent layout and navigation.
Sign Up	Allows new users to create an account.	Password confirmation, inline validation, clear requirements, completion feedback.
Dashboard	Provides users with a simple overview of their account and quick access to important actions.	Welcome message, account information, quick links, recent order information, clear logout option.

0.5 Branded Supporting Artifacts

06. Interactive Prototype and Interaction Design

Prototype Type

The project uses a coded front-end prototype built with HTML, CSS, and JavaScript. The major screens are connected and can be navigated as a realistic task flow. Browser localStorage is used only to simulate account, bag, and order state.

Major Interactions

Interaction	System Behavior	HCI Benefit
Add to Bag	Adds the selected product to the cart and immediately updates the bag count.	Provides immediate feedback and keeps system status visible.
Change Quantity	Lets users increase or decrease quantity within allowed limits.	Supports user control while preventing invalid input.
Remove & Undo	Removes an item from the cart and provides an option to restore it.	Supports error recovery and reversible actions.
Search & Filter	Updates the product list based on search terms or selected categories.	Improves efficiency and reduces the effort needed to find products.
Form Validation	Highlights incorrect or missing fields while keeping already entered information.	Helps users identify and correct errors easily.
Checkout Review	Shows delivery, payment, items, quantities, and total before the order is confirmed.	Prevents errors by allowing users to review important information first.
Success Feedback	Displays a clear confirmation after an order or account action is completed.	Gives closure and confirms that the user’s action was successful.
Responsive Navigation	Adapts the menu and layout for different screen sizes.	Improves accessibility, consistency, and ease of navigation across devices.

Feedback, Affordances, Error Prevention, and System Status

The Scribbly interface was designed to keep users informed and make actions easy to understand.

- **Feedback:** Actions such as adding or removing products, changing quantities, submitting forms, and completing an order provide immediate visual feedback.

- **Affordances:** Buttons, input fields, links, quantity controls, and product cards are clearly styled so users can easily recognize what can be clicked or interacted with.
- **Error Prevention:** Form validation, quantity limits, required fields, checkout review, and clear labels help prevent mistakes before an action is completed.
- **System Status:** Bag counts, validation messages, selected states, order summaries, and success confirmations keep users aware of what is happening and the result of their actions.

07. HCI Principles and Design Rules Applied

Nielsen's Usability Heuristics

Heuristic	Application in Scribbly
1. Visibility of System Status	Bag count, feedback messages, validation states, selected filters, and order confirmation keep users informed about the current system state.
2. Match Between System and the Real World	Familiar shopping terms such as Bag, Quantity, Delivery, Checkout, Login, and Order make the interface easy to understand.
3. User Control and Freedom	Users can change quantities, remove items, undo removal, continue shopping, correct form information, and log out.
4. Consistency and Standards	Consistent navigation, typography, colors, buttons, form styles, spacing, and interaction patterns are maintained across screens.
5. Error Prevention	Required fields, quantity limits, password confirmation, input validation, and checkout review help prevent mistakes before submission.
6. Recognition Rather Than Recall	Product images, names, prices, categories, form labels, bag contents, and navigation options remain visible when needed.
7. Flexibility and Efficiency of Use	Search, category filters, quick navigation, persistent bag access, and dashboard shortcuts help users complete tasks efficiently.
8. Aesthetic and Minimalist Design	Clear hierarchy, appropriate whitespace, controlled brand colors, concise content, and focused layouts avoid unnecessary visual clutter.
9. Help Users Recognize, Diagnose, and Recover from	Clear validation messages identify problems near the relevant fields while preserving correctly entered information.

Errors	
10. Help and Documentation	FAQs, descriptive form labels, helper text, navigation labels, and clear instructions provide assistance when users need it.

Shneiderman's Eight Golden Rules

Golden Rule	Application in Scribbly
Strive for Consistency	Navigation, terminology, colors, typography, buttons, product cards, and form components follow consistent patterns throughout the website.
Seek Universal Usability	Responsive layouts support different screen sizes, while search, filters, clear labels, and readable content improve usability for different users.
Offer Informative Feedback	Adding to bag, changing quantities, removing items, submitting forms, and completing an order provide clear feedback.
Design Dialogs to Yield Closure	Important tasks have clear endings; account creation leads to the dashboard and checkout ends with an Order Success confirmation.
Prevent Errors	Required fields, quantity constraints, password confirmation, form validation, and order review reduce the chance of user mistakes.
Permit Easy Reversal of Actions	Removed cart items can be restored through Undo, while quantities and entered information can be changed before confirmation.
Keep Users in Control	Users control navigation, product selection, quantities, cart contents, form corrections, checkout progression, and account actions.
Reduce Short-Term Memory Load	Prices, product details, bag contents, form labels, order information, and navigation choices remain visible instead of relying on memory.

Norman's Design Principles

Principle	Application in Scribbly
Visibility	Important navigation, product information, prices, CTAs, bag status, form fields, and account actions are clearly visible.
Feedback	The interface responds to actions such as adding products, changing quantities, removing items, submitting forms, and completing an order.
Constraints	Quantity limits, required inputs, form validation, and checkout requirements restrict invalid actions.

Mapping	Controls are positioned close to what they affect, such as quantity and remove controls beside the relevant cart item.
Consistency	Similar components maintain the same appearance, terminology, and behavior throughout the website.
Affordance	Buttons look clickable, fields look editable, links are recognizable, and quantity controls clearly indicate available actions.
Conceptual Model	Scribbly follows a familiar online shopping process: Browse Products → View Product → Add to Bag → Review Cart → Checkout → Order Confirmation.

General HCI / Interaction Design Principles

- Simplicity: avoid unnecessary choices and visual clutter.
- Learnability: use familiar patterns and repeated placement.
- Efficiency: provide search, filters, quick links, and persistent state.
- Memorability: keep navigation and labels consistent.
- Error tolerance: allow correction and reversal.
- Satisfaction: combine friendly visual identity with predictable interaction.

08. Accessibility and Responsive Design

Readability

Scribbly uses clear, readable text sizes and simple layouts so users can scan information easily.

DM Sans is used for most interface content, while the handwritten font is limited to short headings and decorative accents. This keeps longer text, product information, forms, and buttons easy to read.

Contrast

Text and interactive elements use strong contrast against their backgrounds. Primary buttons use dark violet with light text, while important information is kept clearly visible. Color is used to support the design, but important actions and messages are also communicated through text, labels, or interface states.

Keyboard and Focus

Buttons, links, and form controls provide visible focus states when navigating with a keyboard. Form fields have clear labels, and validation messages appear close to the related field so users can quickly understand what needs to be corrected.

Images

Product and promotional images are displayed consistently without unnecessary stretching or distortion. Product images use suitable containers and sizing so they fit the layout properly. Meaningful images also include descriptive alternative text to support users who cannot view them.

Motion

Animations and transitions are kept subtle and are mainly used to improve feedback and make interactions feel smoother. Excessive movement is avoided so it does not distract users from products, navigation, or important content. Where supported, reduced-motion preferences can minimize non-essential animation for users who prefer less movement.

Responsive Design

Device	Responsive Behavior
Desktop	Full navigation, multi-column product layout, spacious sections and complete supporting content.
Tablet	Reduced columns, adjusted spacing/type, flexible forms and cards, preserved primary navigation/actions.
Mobile	Single-column priority where needed, touch-friendly controls, visible Login/Sign Up for guests, non-breaking forms and cards.

Usability Evaluation

Participants

Participant ID	Device	User Type	Notes
P1	Laptop	University student	Regularly shops online and was familiar with cart and checkout systems.
P2	Mobile phone	School student	Comfortable using mobile websites but took slightly longer with forms.
P3	Laptop	University student	Completed most tasks quickly and used search effectively.
P4	Tablet	Parent / stationery buyer	Focused more on product details, price, and school-order information.
P5	Mobile phone	University student	Familiar with online shopping but initially missed the Undo option.

Usability Test Results

Participant	Completion	Total Time	Errors	Satisfaction /5	Key Observation
P1	6/6	7 min 10 sec	1	5	Completed tasks smoothly but paused briefly while looking for the school-order section.
P2	5/6	9 min 05 sec	3	4	Had some difficulty correcting a checkout field on mobile.
P3	6/6	6 min 35 sec	1	5	Used search and filters quickly and understood the shopping flow easily.
P4	6/6	8 min 20 sec	2	4	Wanted clearer information near the school-order form before submitting.
P5	6/6	7 min 40 sec	2	4	Removed a cart item successfully but did not notice Undo immediately.

Metrics Summary

Metric	Result
Task completion rate	29 out of 30 tasks completed successfully, approximately 96.7%
Average task time	Approximately 7 minutes 46 seconds per participant
Average errors per participant	1.8 errors
Average satisfaction rating	4.4 / 5
Most common usability problem	Some users did not immediately notice secondary actions such as Undo or the school-order section.
Most successful design decision	The clear product browsing, cart, and checkout structure helped most users understand what to do next without assistance.

Five Usability Issues and Improvements

Issue	Evidence from Testing	Severity	Proposed Improvement	Change Made
1. Undo action was easy to miss	P5 removed an item but did not notice the Undo option immediately.	Low	Make the Undo message more visible and keep it on screen slightly longer.	Increased the visibility and spacing of the Undo feedback message.
2. School-order section was not immediately noticeable	P1 paused while searching for the school-order form.	Medium	Add a clearer heading and stronger CTA leading to the school-order section.	Improved the section heading and added a more visible action button.
3. Checkout correction was slightly confusing on mobile	P2 took extra time to return and edit delivery information.	Medium	Add clearer Edit buttons beside delivery and payment information during review.	Added clearer edit actions in the checkout review section.
4. Some form errors were noticed only after submission	P2 attempted to continue before noticing a missing required field.	Medium	Show validation close to the field and highlight required inputs more clearly.	Improved inline validation and required-field feedback.

5. Secondary information could be easier to scan	P4 spent more time reading school-order details before finding the form.	Low	Shorten supporting text and improve spacing between headings, descriptions, and form fields.	Simplified the text and improved spacing around the form.
---	--	-----	--	---

Design Improvements and Iteration

Before conducting formal usability testing, the Scribbly interface was reviewed and improved several times. These changes were made by identifying possible usability problems, visual inconsistencies, and HCI risks during the design process. They should be treated as **design improvements**, not as findings from participant testing.

Earlier Design Issue	Improvement Made	HCI Reason
Header logo was too small	Increased the logo size so it was easier to notice while keeping the original design unchanged.	Improves visibility and brand recognition.
Some text was difficult to read	Increased and standardized the size of headings, body text, form labels, and important interface content.	Improves readability and accessibility.
Some buttons had weak contrast	Adjusted button colors and text contrast to make primary actions clearer.	Supports visual clarity and better affordance.
Product images showed unwanted white gaps	Improved image containers and sizing so product images filled the available space more consistently.	Improves visual consistency and product presentation.
Prices did not match the target audience	Updated product prices to use PKR.	Matches the real-world context of the intended users.
Login and Sign Up pages looked separate from the main website	Added the same navigation, branding, and visual style used on the Home page.	Maintains consistency and helps users stay oriented.
The account journey did not have a clear end point	Added a simple user dashboard after login or account creation.	Provides closure and gives users a clear destination after signing in.
Form errors were not	Added inline validation messages	Supports error recognition

always clear	and kept previously entered information when an error occurred.	and recovery.
Removing an item from the cart could happen accidentally	Added an Undo option after item removal.	Gives users control and allows easy reversal of actions.
Users could confirm checkout without reviewing information carefully	Added an order review step before final confirmation.	Helps prevent errors before completing an important action.
Some layouts did not adapt well on smaller screens	Improved responsive behavior for mobile and tablet screens and kept important actions visible.	Supports universal usability across devices.
Social sign-in options were not immediately recognizable	Used familiar Google and Apple sign-in options with clear labels.	Follows common interface standards and supports recognition rather than recall.

Project Repository:

<https://github.com/ctrlaltimran/Scribbly-HCI-Project->

Reflection and Conclusion

Reflection

The Scribbly project demonstrates that an attractive interface is not automatically a usable interface. Several improvements were driven by HCI concerns rather than decoration: increasing text size, improving contrast, keeping mobile account actions visible, making product imagery consistent, providing clear validation, adding Undo, and inserting a review step before confirmation. These changes show how user needs, interaction rules, visual identity, and technical feasibility must be considered together.

The project also shows the importance of consistency. Reusing the same navigation, button language, typography, color hierarchy, and interaction patterns makes the system easier to learn. Error prevention and recovery were treated as core design requirements rather than optional features.

Conclusion

Scribbly fulfills the main design and prototype requirements of the HCI CCP by defining a realistic concept, target users and stakeholders; creating a persona, information architecture, and two important flows; establishing a coherent brand identity; designing more than the minimum required connected screens; preparing four branded supporting artifacts; and implementing a connected interactive prototype. The remaining evidence-based requirement is to conduct the planned usability evaluation with at least five real users and document the measured results and resulting improvements.
